Management of blueberry rust and other diseases

HIA: BB13002

Rosalie Daniel
Plant Pathologist, EMAI, Menangle, NSW
rosalie.daniel@dpi.nsw.gov.au
Overview

• HIA BB13002: Management of blueberry rust - Update
• Botryosphaeria stem blight - Cause - Factors contributing to disease development - Management options
• Early detection – for early treatment
2015: Efficacy of fungicides against blueberry rust

- Sprayed every 10-14 days from March to June
- Leaf area affected by rust assessed every 14 days

2015: Fungicide efficacy results

- Azoxystrobin
- Azoxystrobin + cyproconazole
- Dithianon
- Fenbuconazole
- Mancozeb
- Tebuconazole
- Water (control)
**2016: Fungicides - apply early?**

- Does timing of application affect disease severity?
- Applied after pruning, every 10-14 days

Fungicide timing summary

- Rust infects the young, soft leaves
- Little rust has developed to date
2016: Biological fungicides and defence activators

- Chitosan (Taikang), potassium silicate (AgSil), *Bacillus subtilis*, Aminogro®, copper hydroxide, mancozeb
- Spray every 14 days
- Assessing rust and post-harvest fruit rots
- To date copper and mancozeb are effectively controlling rust
- Harvest in May
Botryosphaeria stem blight

Flagging: rapid reddening and browning of leaves

Vascular discolouration

Crown cankers
Botryosphaeria stem blight

- *Neofusicocum parvum*
- Wound pathogen
- Particularly severe on younger plants (<3y)
- Survives on dead or infected stems
- Spores spread by rain and wind
- Spores present all year round, unless very cold
- Most infection occurs in summer
- Stressed plants are more susceptible
Management of stem blight

- Use disease free plant material
- Resistant or tolerant cultivars
- Avoid damage and wounding
- Avoid pruning during wet weather
- Manage fertilisers – succulent shoots more susceptible
- Prune out infected stems at least 15-20 cm beyond any visible lesion
  - Remove infection from plant
  - Remove inoculum from orchard
Early diagnosis = early treatment = more effective management
Other diseases to look out for now

Botrytis blight and grey mould

Development of fluffy grey growth on flowers is favoured by cool, moist conditions.

Flowers are susceptible as soon as they open. Monitor and treat early, particularly if conditions are favourable for disease.

Anthracnose

Browning of flowers; spore masses pink-orange in colour. Favoured by warm, wet conditions.
